Species	Date(s) Observed	Spawning	Rearing	Migration
Sockeye	August 20, 1984	X		

Comments: Provide any clarifying information, including number of fish observed, location of fish survey data, etc.

^ About 50
^ Spawning Sockeye were seen in the drainage above the proglacial lake east of Bear Glacier. The topographical maps show a lake there and the glacier pinned against the mountain, but the glacier has receded, and that lake has since drained exposing a new drainage. The new lake provides rearing habitat for sockeye and coho.

Attach a copy of a map showing location of mouth and upper points of each species, specific stream reaches identified for spawning or rearing, locations of barriers, such as falls. Attach a copy of the fish survey data, if available.
